If a value is new and does not exist in your TCM database (new client, site, or instructor) you can hit the APPEND button to add the value to TCM and make them selectable in the pick list.

If the instructor inputing the data on-line makes a typo or otherwise makes a mistake in a field, you can pick the correct value from your TCM database to correct the problem.

This prevents multiple entries for the same value that are all slightly different.

Your data from TCM is available as an alphabetical picklist so that you can choose the Course type, Client, and Site for an imported course from the webservice form.
